

NetControl — What It Does and What's Next

Prepared for Shaurrya Teleservices

1. Overview

- **What it is** — a website that connects to your MikroTik routers, so you don't need to open WinBox on each one separately.
 - **How it works** — one program on a server talks to the routers, one website shows the results, and you log in once to see everything.
 - **Best feature** — you can add several routers and switch between them without restarting anything.
 - **Fleet view** — a separate Admin page shows whether every router is online, all in one place.
 - **Backup plan** — if a router can't be reached, the page shows sample data instead of a blank screen.
-

2. How It's Built

- **Website (frontend)** — what you see and click in the browser.
 - **Server (backend)** — runs behind the scenes, talks to the routers, and keeps you logged in.
 - **Router connection** — newer routers use one connection method, older ones use another. The app tries the newer one first and switches automatically if that fails, so both kinds of routers can be managed the same way.
-

3. What You Can Do — Page by Page

- **Devices** — add a router by its IP address, check if it's online, switch which one you're viewing.
- **Dashboard** — see CPU, memory, temperature, uptime, and internet traffic.
- **Admin panel** — see the status of every router at once.
- **Interfaces & Wireless** — see connected cables and Wi-Fi, and who's connected.

- **DHCP, Firewall, IP Addresses** — view network settings (view only, no editing).
 - **PPP** — see active dial-in connections and manage PPP accounts.
 - **WireGuard** — set up and manage VPN connections.
 - **Logs & Users** — view the router's activity log and its user accounts.
 - **Settings & Login** — log in, and see basic router information.
-

4. What the Server Offers

AREA	VIEW OR CHANGE?	NOTE
Login	Change	One fixed account, no sign-up.
Router health	View	Can be checked even before logging in.
Interfaces & Wi-Fi	View	Works with older and newer Wi-Fi setups.
DHCP, firewall, IPs	View	Read only.
Logs & users	View	Shows the most recent 300 log entries.
PPP	View & change	Add, turn on/off, or delete accounts.
WireGuard	View & change	The base the tunnel feature below builds on.
Traffic history	View	Comes from saved records, not a live check.
Devices list	View & change	Add, remove, or switch routers.
Admin overview	View	Status of every router in one go.

5. How the Tricky Parts Work

- **Checking if a router is online** — the app remembers the answer for 15 seconds so the page loads fast, and checks again quietly in the background.
 - **Tracking internet traffic** — routers don't save this history themselves, so the app checks every few seconds and saves it on its own.
 - **Talking to routers** — one steady connection is used for whichever router you're viewing. Checking on all routers at once uses quick, temporary connections instead.
-

6. Coming Soon

FEATURE	WHAT IT DOES
Connect two routers with a tunnel	Set up a private connection between two of your routers automatically, from one screen — instead of configuring each router by hand.
Alerts	Get a message if a router or connection goes down.
Separate logins per person	Some people can only view, others can make changes.
Backup & restore settings	Save a router's settings and undo changes if something breaks.
Mobile app	Check your routers from your phone.
